

NAME

scriptrouted – Network measurement server

SYNOPSIS

scriptrouted [**--help**] [**--version**] [**--config=<configuration file>**] [**--port=<service port>**] [**--disable-daemon**] [**--verbose**]

DESCRIPTION

Scriptroute is a system for distributed network measurement and debugging. The scriptroute daemon provides an interface for user-owned processes to send measurement traffic and receive responses.

OPTIONS

--help, -h

Show a summary of command line options

--version, -V

Show the scriptroute daemon version.

--config, -c

Use the specified configuration file. Be sure to use this option, as the default configuration may not be exactly what you want, and will not publish the correct administrator's address.

--port, -p

Provide service on a port other than 3356. This is not well supported.

--disable-daemon, -d

Run in the foreground, don't turn into a daemon. Only really useful for debugging.

--verbose, -v

Print more debugging messages than normal. Such additional messages will go into syslog under daemon.debug.

BUGS

Send bug reports or suggestions to <bugs@scriptroute.org>.

FILES

/etc/scriptroute/scriptroute.conf

Scriptroute configuration file.
